

ARTIFICIAL INTELLIGENCE  
By John Binks

# CONVERSATIONAL & Custom service bots

Artificial intelligence is radically redefining the customer service landscape. From automated messages to visual search. Allows companies to support their customers.

Conversational chatbots interact with users in a natural, human-like manner. They use text or voice interfaces to communicate, making the interaction intuitive and user-friendly.

Conversational chatbots are available 24/7, providing users with constant support and immediate responses, which is particularly beneficial for customer service applications.

They help in automating tasks, providing information, and assisting users in various processes.
